

SharePoint® Health Check — Optimizing Your Application Environment

BUSINESS SOLUTION

The Allin SharePoint® Health Check Assessment will help you to take full advantage of your IT investment

MAXIMIZE YOUR IT INVESTMENT

- Assess the impact of information access in your SharePoint® environment
- Analyze the effectiveness and impact of working with groups around the world to exchange ideas
- Deliver LAN-like application performance to remote offices

ARE YOU EXPERIENCING?

- Substantial SharePoint application performance slow downs due to congested networks and relatively high latency
- Unsatisfactory SharePoint® end-user experience
- Low SharePoint® adoption rate across the enterprise

BUSINESS IMPACT

- Effectively deploy and manage a secure SharePoint® environment for greater user productivity
- Realize performance improvements will result in greater productivity of Share Point users across a WAN infrastructure resulting in cost savings
- Gain increased performance, reliability and scalability for critical business services

SHAREPOINT® COLLABORATION

Microsoft® Windows™ SharePoint™ Services in Windows™ Server 2003 makes it simple for IT professionals to implement and manage a team collaboration infrastructure and deliver immediate benefits to users. SharePoint® has become an indispensable collaboration tool for many professionals, allowing them to easily compose, share, and organize critical business documents.

SHAREPOINT® HEALTH CHECK

The SharePoint® Health Check is specifically designed to give your company's current collaboration systems a health check, generate a roadmap for managing content, direct where overall information access and application response times improvements can improve end-user experiences, aid in compliance with company policies, mitigate security risks, and offer prescriptive guidance. The SHC is designed for senior IT staff members and engineers in charge of support and management of their SharePoint® environments; as well as for business analysts responsible for business process optimization. Allin will help to assess how well your organization has implemented Microsoft® Solutions to enable an efficient business collaboration — one that enables people to connect with customers, answer questions, make sales, close deals, and work together to make the thousands of small decisions that collectively add up to success.

ALLEVIATING WAN BOTTLENECKS WITH CERTEON

Speed and scalability are especially critical in SharePoint® environments where more and more HTTP traffic is competing for bandwidth over high latency WANs. As increased traffic across the WAN results in network congestion, slower application response times, and a poor user experience, IT professionals can deploy Certeon S-Series™ Application Acceleration Appliances in their data center and branch offices.

By including Certeon S-Series™ Application Acceleration Appliances as part of an overall SharePoint® Portal implementation, end users will experience LAN-like response times even when they are accessing a remote SharePoint® server. The result is high performance for all SharePoint® knowledge workers, regardless of their location on the WAN.

SECURE APPLICATION ACCELERATION

S-Series™ Application Acceleration Appliances from Certeon deliver what Microsoft® Office™ System and SharePoint® users need — a responsive and secure end-user experience. Certeon delivers a dramatic reduction in application response times and enables data security by supporting SSL from the branch desktop to the data center SharePoint® server and back again. Customers that deploy Microsoft® Office™ System and SharePoint® with Certeon S-Series™ are able to achieve LAN-like response times over their WANs, supporting more users over existing bandwidth.

SharePoint® Health Check – Optimizing Your Application Environment

The results are astounding:

- More than a 1000% reduction in application response times
- Increased productivity for branch office workers
- Support for more users and more applications over existing bandwidth
- Drastic reduction in net network utilization
- Enhanced Microsoft® Office™ System and SharePoint® customer satisfaction

THE VALUE TO YOUR BUSINESS

The collaboration of Allin Consulting and Certeon Application Acceleration Appliances results in a SharePoint® Portal Server solution that delivers a high level of information availability and rapid access to information in your SharePoint® environment.

Allin and Certeon deliver:

- Quicker access to enterprise information
- Significantly faster information retrieval
- Measurably improved user productivity and application experience
- Lower networking and operational costs

Allin and Certeon provide the optimum solution for efficient enterprise information sharing and access through Microsoft® SharePoint® Portal Server.

ABOUT ALLIN

Allin Corporation is a leading Microsoft® Gold Certified Information Technology Consulting firm. Allin delivers its services through four practice areas: Technology Infrastructure, Collaborative Solutions, Interactive Media and Business Process. Allin leverages its experience in these areas to work with clients through a disciplined project delivery framework to ensure that solutions are delivered on time and on budget.
